A HISTORY OF INNOVATION

1936 Associated Research was founded.

1939 We introduced the first battery operated Megohmmeter, the Vibrotest, in the United States.

1966 We commenced the first Cable Testing/Fault Location school known as ARU. ARU continued for over 25 years.

1993 We introduced the first complete family of microprocessor-controlled electrical safety instruments.

1995 We developed the first multi-function electrical safety compliance analyzer.

1997 We released the first electrical safety instrument with a built-in multiplexer for multi-point testing.

1999 We introduced Autoware, the first software package for automated instrument control, in the EST industry.

2001 We released our patented safety feature, SmartGFI®, to provide our customers with maximum operator protection during high voltage testing.

2012 We launched the first electrical safety compliance analyzer with a built-in AC power source.

2013 We developed the first mobile app in the electrical safety testing industry.

2017 We launched the Applications Consulting program.

Why We Use Counts
Associated Research publishes some specifications using "counts" which allows us to provide a better indication of the instrument's capabilities across measurement ranges. A count refers to the lowest resolution of the display for a given measurement range. For example, if the resolution for voltage is 1V then 2 counts = 2 V.

Specifications subject to change without notice.

Why We Use Counts
Associated Research publishes some specifications using "counts" which allows us to provide a better indication of the instrument's capabilities across measurement ranges. A count refers to the lowest resolution of the display for a given measurement range. For example, if the resolution for voltage is 1V then 2 counts = 2 V.

Specifications subject to change without notice.

Why We Use Counts
Associated Research publishes some specifications using "counts" which allows us to provide a better indication of the instrument's capabilities across measurement ranges. A count refers to the lowest resolution of the display for a given measurement range. For example, if the resolution for voltage is 1V then 2 counts = 2 V.
